DOC.4444 (PANS_ATM)

Provided By : Ali - Dalirian

(Introduction)

PANS – ATM :

PROCEDURES FOR AIR NAVIGATION SERVICES – AIR TRAFFIC MANAGEMENT

AIR TRAFFIC MANAGEMENT (ATM) :

- The dynamic, integrated management of air traffic and airspace- safely, economically and efficiently.
- Doccument 4444 is published by international civil aviation organization (I.C.A.O) prepared by the air traffic control committee in march 1946.
- This doccument consists of sixteen chapters plus six appendices with totally 440 pages.

NOTE 1: ALTHOUGH THESE PROCEDURES ARE MAINLY DIRECTED TO AIR TRAFFIC SERVICES PERSONNEL, FLIGHT CREWS SHOULD BE FAMILIAR WITH THE CERTAIN PROCEDURES CONTAINED.

NOTE 2: THE OBJECTIVES OF THE AIR TRAFFIC CONTROL SERVICE AS PRESCRIBED IN ANNEX 11, DO NOT INCLUDE PREVENTION OF COLLISION WITH TERRAIN, THEREFORE;

THE PROCEDURES PRESCRIBED IN THIS DOCUMMENT DO NOT RELIEVE PILOTS OF THEIR RESPONSIBILITY TO ENSURE THAT ANY CLEARANCES ISSUED BY AIR TRAFFIC CONTROL UNITS ARE SAFE IN THIS RESPECT, SUCH AS, WHEN AN IFR FLIGHT IS VECTORED OR IS GIVEN A DIRECT ROUTING WHICH TAKES THE AIRCRAFT OFF AN ATS ROUTE.

(Chapter one-definitions)

NOTE : The term "service " is used as an abstract noun to designate functions, or service rendered; the term "unit " is used to designate a collective body performing a service .

TRANSFERRING UNIT/CONTROLLER :

Air traffic control unit/air traffic controller in the process of transferring the responsibility for providing air traffic control service to an aircraft to the next air traffic control unit/ air traffic controller along the route of flight.

ACCEPTING UNIT/CONTROLLER :

Air traffic control unit/air traffic controller next to take control of an aircraft.

(Transferring control of an aircraft from a unit to another)

DOWN-STREAM CLEARANCE :

A clearance issued to an aircraft by an ATC unit that is not the current controlling authority of that aircraft.

TRANSFER OF CONTROL POINT :

A defined point located along the flight of an aircraft, at which the responsibility for providing air traffic control service to the aircraft is transferred from one control unit or control position to the next.

(Transfer of control point on en-route IFR chart with frequency)

ADVISORY AIRSPACE (ADA) :

An airspace of defined dimensions, or designated route, within which air traffic advisory service is available.

ADVISORY ROUTE (ADR) :

> A designated route along which air traffic advisory service is available.

AIR TRAFFIC ADVISORY SERVICE :

A service provided within advisory airspace to insure separation, in so far as practical, between aircraft which are operating on IFR flight plans. **NOTE** : advisory service shall not be provided based on the term ``clearance`` .

AERODROME :

A defined area on land or water (including any buildings, installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of aircraft.

APRON:

A defined area, on a land aerodrome, intended to accommodate aircraft for purposes of loading, or unloading passengers, mail or cargo, fuelling, parking or maintenance.

MANOEUVRING AREA :

That part of an aerodrome to be used for the take-off, landing and taxiing of aircraft , excluding apron .

MOVEMENT AREA :

That part of an aerodrome to be used for take-off, landing and taxiing of aircraft, consisting of the movement area and the apron.

AERODROME CONTROL SERVICE :

> Air traffic control service for aerodrome traffic .

AERODROME CONTROL TOWER :

A unit established to provide air traffic control service to aerodrome traffic.

AERODROME ELEVATION :

The elevation of the highest point of the landing area.

AERODROME TRAFFIC :

All traffic on the manoeuvring area of an aerodrome and all aircraft flying in the vicinity of an aerodrome.

NOTE : an aircraft is in the vicinity of an aerodrome when it is in, entering or leaving an aerodrome traffic circuit .

AERODROME TRAFFIC CIRCUIT :

The specified path to be flown by aircraft operating in the vicinity of an aerodrome.

(Typical of a traffic circuit in an aerodrome)

AERONAUTICAL INFORMATION PUBLICATION (AIP) :

A publication issuer by or with the authority of a state and containing aeronautical information of a lasting character essential to air navigation.

AIRBORN COLLISSION AVOIDANCE SYSTEM (ACAS) :

An aircraft system based on secondary surveillance radar (SSR) transponder signals which operates independently of ground-based equipment to provide advice to the pilot on potential conflicting aircraft that are equipped with SSR transponders.

AIRCRAFT :

Any machine that can derive support in the atmosphere from the reactions of the air other than the reactions of the air against the earth's surface.

AIRCRAFT IDENTIFICATION :

A group of letters, figures or a combination is , , the aircraft call sign used to identify the aircraft in air-ground air traffic services communications .

AIRCRAFT PROXIMITY :

A situation in which, in the opinion of a pilot or air traffic services personnel, the distance between aircraft as well as their relative positions and speed have been such that the safety of the aircraft involved may have been compromised.

AIRPROX:

The code word used in an air traffic incident report to designate aircraft proximity .

aircraft proximity is classified as follows :

- Risk of collision : The risk classification of an aircraft proximity in which serious risk of collision has existed.
- Safety not assured : The risk classification of an aircraft proximity in which the safety of the aircraft may have been compromised .

- No risk of collision : The risk classification of an aircraft proximity in which no risk of collision has existed .
- Risk not determined : The risk classification of an aircraft proximity in which insufficient information was available to determine the risk involved.

AIR-GROUND COMMUNICATION :

Tow-way communication between aircraft and stations or locations on the surface of the earth.

AIR-TO-GROUND COMMUNICATION :

One-way communication from aircraft to stations or locations on the surface of the earth.

AIR-REPORT (AIREP):

A report from an aircraft in flight prepared inconformity with requirements for position, and operational and/or meteorological reporting.

AIRMET INFORMATION :

Information issued by a meteorological watch office concerning the occurrence or expected occurrence of specified en-route weather phenomena which may effect the safety of low-level aircraft operations and which was not already included in the forecast issued.

AIRTAXIING :

Movement of a helicopter/VTOL above the surface of an aerodrome, normally in ground effect and at a ground speed normally less than 37km/h(20kt). NOTE : The actual height may vary, and some helicopter may require air-taxiing above 8m (25ft) AGL to reduce ground effect turbulence or provide clearance for cargo slingloads .

AIR TRAFFIC CONTROL CLEARANCE :

Authorization for an aircraft to proceed under conditions specified by an air traffic control unit.

AIR TRAFFIC :

All aircraft in flight or operating on the manoeuvring area of an aerodrome.

AIR TRAFFIC CONTROL SERVICE :

> A service provided for the purpose of :

a) preventing collisions between aircraft, and; on the manooeuvring area between aircraft and obstructions; and

b) expediting and maintaining an orderly fellow of air traffic.

AIR TRAFFIC CONTROL UNIT :

A generic term meaning variously, area control center, approach control unit or aerodrome control tower.

AIR TRAFFIC SERVICE (ATS) :

A generic term meaning variously, flight information service, alerting service, air traffic advisory service, air traffic control service, area control service, approach control service or aerodrome control tower.

AIR TRAFFIC SERVICE AIRSPACE :

Airspaces of defined dimensions, alphabetically designated, within which specific types of flights may operate and for which air traffic services and rules of operation are specified . (ATS airspaces are classified as A to G).

AIR TRAFFIC SERVICE REPORTING OFFICE (ARO):

A unit established for the purpose of receiving reports concerning air traffic services and flight plans submitted before departure.

ALERTING SERVICE :

A service provided to notify appropriate organizations regarding aircraft in need of search and rescue aid, and assist such organizations as required.

NOTE 1 : The Alerting Service is provided by the ATS unit responsible for the aircraft at that moment.

NOTE 2 : Alerting Service shall be provided :

for all controlled flight, to any aircraft known to be subject of unlawful interference, and to all aircraft having filed a flight plan or known to the ATS.

NOTE 3 : The **ATS** unit is responsible to **Initiate** a phase of **emergency**.

The phases related to an aircraft in emergency or believed in emergency are:

1) uncertainty phase, 2) alert phase, 3) distress phase.

ALERT PHASE :

A situation wherein apprehension exists as to the safety of an aircraft and its occupants.

ALERFA :

> The code word used to designate an alert phase .

UNCERTAINTY PHASE :

A situation wherein uncertainty exists as to the safety of an aircraft and its occupant.

INCERFA:

The code word used to designate an uncertainty phase .

DISTRESS PHASE :

A situation wherein there is reasonable certainty that an aircraft and its occupants are threatened by grave and imminent danger or require immediate assistance.

DETRESFA :

> The code word used to designate a distress phase .

ALTERNATE AERODROME :

An aerodrome to which an aircraft may proceed when it becomes either impossible or inadvisable to proceed to or land at the aerodrome of intended landing.

ALTERNATE AERODROMES INCLUDE THE FOLLOWING :

- TAKE-OFF ALTERNATE : An alternate aerodrome at which an aircraft can land should this become necessary shortly after take-off and it is not possible to use the aerodrome of departure.
- EN-ROUTE ALTERNATE : An aerodrome at which an aircraft would be able to land after experiencing an abnormal or emergency condition while en route.
- DESTINATION ALTERNATE : An alternate aerodrome to which an aircraft may proceed should it becomes either impossible or inadvisable to land at the aerodrome of intended landing.

NOTE : The aerodrome from which a flight departs may also be an en-route alternate or a destination alternate aerodrome for that flight .

(The visibility required for take-off from Esfahan/Shahid Beheshti airport)

APPROACH CONTROL SERVICE :

> Air traffic control service for arriving or departing controlled flights .

APPROACH CONTROL UNIT :

A unit established to provide air traffic control service to controlled flights arriving at, or departing from one or more aerodromes.

APPROACH SEQUENCE :

The order in which two or more aircraft are cleared to approach to land at the aerodrome.

AREA CONTROL SERVICE :

> Air traffic control service for controlled flights in control area .

AREA CONTROL CENTER(ACC) :

A unit established to provide ATC service to controlled flights in control areas under its jurisdiction, identified by the name of nearby city.

APPROPRIAE ATS AUTHORITY :

The relevant authority designated by the state responsible for providing air traffic services in the airspace concerned.

APPROPRIATE AUTHORITY :

a)Regarding fight over the high seas : The relevant authority of the state of registry .

b)Regarding flight other than over the high seas : The relevant authority of the state having sovereignty over the territory being overflown .

AREA NAVIGATION (RNAV) :

A method of navigation which permits aircraft operation on any desired flight path within the coverage of the station-referenced navigation aids or within the limits of the capability of self-contained aids, or a combination of these.

An ATS route established for the use of aircraft capable of employing area navigation.

BENEFITS OF RVAV TECHNIQUES :

- 1. Establishment of more directly routes reducing the flight distance.
- 2. Establishment of duall or parallel route so, a greater flow of traffic.
- 3. Establishment of bypass routes for high density traffic areas.
- 4. Reduce the number of ground navigation facilities.

RNP TYPE :

- A containment value expressed as a distance in nautical miles from the intended position within which flights would be for at least 95 per cent of the total flying time.
- For example, RNP 4, represents a navigation accuracy of plus or minus 7.4km (4NM) on a 95 per cent containment basis.

AUTOMATIC DEPENDENT SURVEILLANCE (ADS) :

A surveillance technique in which aircraft automatically provide, via data link, data derived from on-board navigation and position-fixing systems.

AUTOMATIC TERMINAL INFORMATION SERVICE (ATIS) :

The automatic provision of current, routine information to arriving and departing aircraft throughout 24 hours or a specified portion.

ATIS :

- The symbol used to designate automatic terminal information service .
- ABOUT ATIS : Broadcasted by voice ATIS or D-ATIS / To reduce voice communication / One for arriving or one for departing aircraft or one for both arriving and departing aircraft / A discrete VHF frequency shall be used, if not possible, on VOR frequency, not ILS / The broadcast shall be continuous and repetitive / Information contained shall be related to approach, landing and takeoff / For international use, the ATIS should be available in the English / The ATIS broadcast should not exceed 30 seconds / The information shall relate to a single aerodrome / The information shall be updated immediately a significant change occurs / ATIS message shall be the responsibility of the ATS / ATIS message shall be identified by a ICAO spelling alphabet, and shall be in alphabetical order.

- Pilots shall acknowledge ATIS information reception upon establishing communication with approach or tower (only altimeter setting).
- ATS when replying, shall provide the pilots with the current altimeter setting and any elements that need updating.

CONTENTS OF ATIS FOR BOTH ARRIVING AND DEPARTING AIRCRAFT :

Name of the aerodrome / designator / time of observation / type of approach/ runway in use / runway surface condition / holding delay/ transition level / other operational information / wind speed and direction / visibility and RVR / present weather / cloud below 1500m (5000ft) or below the highest minimum sector altitude, whichever is greater / cumulonimbus / air temperature / dew point / altimeter setting.

NOTE : Runway Visual Range is reported and passed to an aircraft when the visibility falls below 1,500 m.

ATS ROUTE :

A specified route designed for channeling the flow of traffic as necessary for the provision of air traffic services.

NOTE 1 : The term " **ATS route** " is used to mean variously, airway, advisory route, controlled or uncontrolled route, arrival or departure route, etc .

NOTE 2 : An ATS route is defined by route specification which include an ATS route designator, the track to or from significant points (waypoints), distance between significant points, reporting requirements and, as determined by the appropriate ATS authority, the lowest safe altitude .

AIRWAY :

> A control area or portion thereof established in the form of a corridor equipped with VOR or NDB.

(Airway between TBZ and RST with specified information)

NOTE 1 : Airways are designated by alphabet/numeric basies , depending on either ATS routes or R-NAV routes .

The establishment of change-over points should be limited to route segments of 110 km (60 NM) or more, Except in some special cases.

(Change-over-points are defined for VOR routes of more than 60 N.M)

STANDARD INSTRUMENT DEPARTURE (SID) :

A designated IFR departure route linking the aerodrome or a specified runway of the aerodrome with a specified significant point, normally on a designated ATS route, at which the en-route phase of flight commences.

(IFR departure route followed by aircraft to join points NAGMA and EGVEL)

NOTE 2 : SIDs are designated by the name of the point where the en-route structure of the flight begins .

STANDARD INSTRUMENT ARRIVAL (STAR) :

A designated IFR arrival route linking a significant point, normally on an ATS route, with a point from which a published instrument approach procedure (IAP) can be commenced (IAF).

(STARs followed by aircraft to leave airway toward I.A.F for approach)

NOTE 3 : STARs are designated by the name of the point where the en-route structure ends and instrument approach procedure begins .

Textual Description (Examples)	Symbology
Altitude window / Between 3000' and 6000'	6000' 3000'
At or above / Above 3000'	<u>3000′</u>
At or below / Below 5000'	5000'
Mandatory 4000'	4000'
Recommended 9000'	9000′
Expect FL90	Expect FL90
At 9000' or altitude provided by ATC	9000' or by ATC

(Description of altitudes depicted on instrument charts)

BASE TURN :

➢ A turn executed by the aircraft during the initial approach between the end of the outbound track and the beginning of the intermediate or final approach track. The tracks are not reciprocal.

NOTE : Base turns may be designed as being made either in level flight or while descending, according to the circumstances of each individual procedure .

BLIND TRANSMISSION :

- A transmission from one station to another station in circumstances where tow-way communication cannot be established but where it is believed that the called station is able to receive the transmission.
- If radio communication failure is experienced on an IFR flight in IMC, generally the pilot shall try to get contact on other frequencies either ground or aircraft stations and transmit blind indicating important details required 2 times.

BROADCAST:

A transmission of information relating to air navigation that is not addressed to a specific station or s stations.

CEILING :

The height above the ground or water of the base of the lowest layer of cloud below 6000m (20,000ft) covering more than half the sky.

CLEARANCE LIMIT :

> The point to which an aircraft is granted an air traffic control clearance.

CODE (SSR) :

The number assigned to a particular multiple pulse reply signal transmitted by a transponder in mode A or mode C.

CONTROL AREA :

A controlled airspace extending upwards from a specified limit above the earth (the minimum height AGL for the base of a CTA is 200 m or700 ft).

CONTROLLED AERODROME :

An aerodrome at which air traffic control service is provided to aerodrome traffic.

CONTROLLED AIRSPACE :

An airspace of defined dimensions within which air traffic control service is provided in accordance with the airspace above.

NOTE: Controlled airspace is a generic term which covers ATS airspace classes A, B, C, D and G.

CONTROLLED FLIGHT :

Any flight which is subject to an air traffic control clearance.

CONTROL ZONE :

A controlled airspace extending upwards from the surface of the earth to a specified upper limit (at least 5 n.m in the direction of approach).

(Control zone (CTR) for Yazd and Kerman aerodrome with specified limit)

CRUISE CLIMB :

An aeroplane cruising technique resulting in a net increase in altitude as the airplane mass decreases.

CRUISING LEVEL :

> A level maintained during a significant portion of flight .

CURRENT FLIGHT PLAN (CPL) :

The flight plan, including any changes, if any, brought about by subsequent clearances.

DECISION ALTITUDE (D.A) OR DECISION HEIGHT (D.H) :

A specified altitude or height in the precision approach or approach with vertical guidance at which a missed approach must be initiated if the required visual reference to continue the approach has not been established.

NOTE : Decision altitude (DA) is referenced to mean sea level and decision height (DH) is referenced to the threshold elevation .

(DA(H)s are specified in landing minimums section of I.A.P charts)

DEPENDENT PARALLEL APPROACHES :

Simultaneous approaches to parallel or near-parallel instrument runways where radar separation minima between aircraft on adjacent runway center lines are prescribed.

INDEPENDENT PARALLEL APPROACHES :

Simultaneous approaches to parallel or near-parallel instrument runways where radar separation minima between aircraft on adjacent extended runway center lines are not prescribed.

INDEPENDENT PARALLEL DEPARTURES :

Simultaneous departures from parallel or near-parallel instrument runways.

NEAR-PARALLEL RUNWAYS :

Non-intersecting runways whose extended center lines have an angle convergence of 15 degrees or less.

DISCRETE CODE :

> A four-digit SSR code with the last two digits not being " 00".

ELEVATION :

The vertical distance of a point or a level, on or affixed to the surface of the earth, measured from mean sea level.

EMERGENCY PHASE :

A generic term meaning, as the case may be, uncertainty phase, alert phase or distress phase.

ESTIMATED OFF-BLOCK TIME (EOBT):

> The estimated time at which the aircraft will commence movement associated with departure .

ESTIMATED ELAPSED TIME (EET) :

The estimated time required to proceed from one significant point to another.

TOTAL ESTIMATED ELAPSED TIME (TOTAL EET) :

For IFR flights, the estimated time required from take-off to arrive that designated point, defined by reference to navigation aids, from which it is intended that an instrument approach procedure will be commenced, or if no navigation aid is associated with destination aerodrome, to arrive over the destination aerodrome. for VFR flights, the estimated time required from take-off to arrive over the destination aerodrome.

ESTIMATED TIME OF ARRIVAL (ETA) :

For IFR flights, the time at which it is estimated that the aircraft will arrive over that designated point, defined by reference to navigation aids, from which it is intended that an instrument approach procedure will be commenced, or, if no navigation aid is associated with aerodrome, the time at which the aircraft will arrive over the aerodrome. for VFR flights, the time at which it is estimated that the aircraft will arrive over the aerodrome.

EXPECTED APPROACH TIME (EAT) :

The time at which ATC expects that an arriving aircraft, following a delay, will leave the holding fix to complete its approach for a landing.

NOTE : The actual time of leaving the holding fix, will depend upon the approach clearance .

FILED FLIGHT PLAN (FPL) :

> The flight plan as filed with an ATS unit by the pilot or a designated representative, without any subsequent changes .

FINAL APPROACH :

That part of an instrument approach procedure which commences at the specified final approach fix or point, or;

where no such a fix or point is not specified :

a) at the end of the last procedure turn, base turn or inbound turn of a race track procedure, if specified; or

b) at the point of interception of the last track specified in the approach procedure; and

- ends at a point in the vicinity of aerodrome (missed approach point) from which :
- 1) a landing can be made; or
- 2) a missed approach procedure is initiated.

(In NPAs, Final approach segment, commences at FAF and ends at MAP)

(Final approach segment, where no final approach fix is specified)

(In PAs, final segment begins when the aircraft intersects with glide slope)

FLIGHT CREW MEMBER :

A licensed crew member with charged duties essential to the operation of an aircraft during a flight duty period.

FLIGHT INFORMATION CENTER (FIC) :

A unit established to provide flight information service and alerting service. FLIGHT INFORMATION REGION (FIR) :

An airspace of defined dimensions within which flight information service and alerting service are provided.

FLIGHT INFORMATION SERVICE (FIS) :

A service provided for the purpose of giving advice and information useful for the safe and efficient conduct of flights.

NOTE : Aerodrome Flight Information Service (AFIS), can only supply limited services and under no circumstances may it supply ATC services.

FLIGHT LEVEL :

A surface of constant atmospheric pressure which is related to a specific pressure datum, 1013.2 hectopascals (hpa), and is separated from other such surfaces by specific pressure intervals.

NOTE : A **pressure type altimeter** is calibrated in accordance with the standard atmosphere :

- a) when set to a QNH altimeter setting, will indicate altitude ;
- b) when set to a **QFE** altimeter setting, will indicate height;
- c) when set to a pressure of 1013.2 hpa, may be used to indicate flight level .

(Aircraft maintaining a constant level, but, in relation to various settings)

LEVEL :

A generic term relating to the vertical position of an aircraft in flight and meaning variously, height, altitude or flight level.

FLIGHT PLAN :

Specified information provided to air traffic service units, relative to an intended flight or portion of a flight of an aircraft.

FORECAST :

A statement of expected meteorological conditions for a specified time or period, and for a specified area or portion of airspace.

GROUND VISIBILITY :

The visibility at an aerodrome, as specified by an accredited observer or by automatic systems.

FLIGHT VISIBILITY :

The visibility forward from the cockpit of an aircraft in flight.

GLIDE PATH :

> A descent profile determined for vertical guidance during final approach .

HEADING :

➤ The direction which the longitudinal axis of an aircraft is pointed, usually expressed in degrees from north (true, magnetic, compass or grid).

HOLDING FIX :

> A geographical location that serves as a reference for a holding procedure.

HOLDING PROCEDURE :

A predetermined maneuver which keeps an aircraft within a specified airspace while awaiting further clearance.

(Entry to holding pattern parallel, off-set or tear drop and direct entry)

HOT SPOT :

- A location on an aerodrome movement area with a history or potential risk of collision or runway incursion, and where heightened attention by pilots/ drivers is necessary.
- ICAO recommends the local generation of AIP charts to show runway hot spots, which, must be kept up to date and revised as necessary.

IFR FLIGHT :

> A flight conducted in accordance with the instrument flight rules .

IFR :

The symbol used to designate the instrument flight rules.

VFR FLIGHT :

> A flight conducted in accordance with the visual flight rules .

VFR:

> The symbol used to designate the visual flight rules .

VISUAL METEORPLOGICAL CONDITIONS (VMC):

Meteorological conditions expressed in the term of visibility, distance from cloud, and ceiling equal to or better than specified minima.

Altitude band	Airspace class	Flight visibility	Distance from cloud
At and above 3 050 m (10 000 ft) AMSL	A*** B C D E F G	8 km	1 500 m horizontally 300 m (1 000 ft) vertically
Below 3 050 m (10 000 ft) AMSL and above 900 m (3 000 ft) AMSL, or above 300 m (1 000 ft) above terrain, whichever is the higher	A***B C D E F G	5 km	1 500 m horizontally 300 m (1 000 ft) vertically
At and below 900 m (3 000 ft) AMSL, or 300 m	A***B C D E	5 km	1 500 m horizontally 300 m (1 000 ft) vertically
(1 000 ft) above terrain, whichever is the higher	F G	5 km**	Clear of cloud and with the surface in sight

* When the height of the transition altitude is lower than 3 050 m (10 000 ft) AMSL, FL 100 should be used in lieu of 10 000 ft.

** When so prescribed by the appropriate ATS authority:

- a) flight visibilities reduced to not less than 1 500 m may be permitted for flights operating:
 - 1) at speeds that, in the prevailing visibility, will give adequate opportunity to observe other traffic or any obstacles in time to avoid collision; or
 - 2) in circumstances in which the probability of encounters with other traffic would normally be low, e.g. in areas of low volume traffic and for aerial work at low levels.
- b) HELICOPTERS may be permitted to operate *in less than 1 500 m* flight visibility, if manoeuvred at a speed that will give adequate opportunity to observe other traffic or any obstacles in time to avoid collision.
- *** The VMC minima in Class A airspace are included for guidance to pilots and do not imply acceptance of VFR flights in Class A airspace.

(Meteorological conditions required to fly in accordance with VFR)

VMC :

> The symbol used to designate visual meteorological conditions .

INSTRUMENT METEORPLOGICAL CONDITIONS (IMC):

Meteorological conditions expressed in the term of visibility, distance from cloud, and ceiling, less than the minima specified for visual meteorological conditions.

IMC :

> The symbol used to designate instrument meteorological conditions .

NOTE : In a control zone, a VFR flight may proceed under instrument meteorological conditions if and as authorized by air traffic control.

SPECIAL VFR FLIGHT (SVFR) :

- A VFR flight cleared by air traffic control to operate within a control zone in meteorological conditions below VMC.
- minimum ground visibility required to enable a SVFR flight to take off from an aerodrome in a CTR according to ICAO legislation is 1,500 m, and, according to iran AIP is 2,000 m.
- VFR operations can be suspended by The area control center within whose CTA the aerodrome is located.
- The decision in which a flight to be operated either in accordance with IFR flight rules or VFR flight rules is the responsibility of pilot-in-command.

LANDING AREA :

That part of a movement area intended for the landing or take-off of aircraft.

RUNWAY:

A defined rectangular area on a land aerodrome prepared for the landing and take-off of aircraft.

ACCIDENT :

An occurrence associated with the operation of an aircraft which takes place between the time any person boards the aircraft with the intention of flight until such time as all persons have disembarked, in which :

a) a person is fatally or seriously injured;

b) the aircraft sustains damage or structural failure;

c) the aircraft is missing or completely inaccessible.

NOTE 1: An aircraft is considered to be missing when the official search has been terminated and the wreckage has not been located .

NOTE 2 : The type of incidents are of main interest to the International Civil Aviation Organization (ICAO) for accident prevention studies .

INCIDENT:

An occurrence, other than an accident, associated with the operation of an aircraft which affects or could affect the safety of operation.

INSTRUMENT APPROACH PROCEDURE (IAP) :

A series of predetermined maneuvers by reference to flight instruments with specified protection from obstacles from the initial approach fix, or where applicable, from the beginning of a defined arrival route to a point from which a landing can be completed (missed approach point) and thereafter, if a landing is not completed, to a position at which holding or en-route obstacle clearance criteria apply.

I.A.Ps ARE CLASSIFIED AS FOLLOWS :

NON-PRECISION APPROACH (N.P.A) PROCEDURE :

An instrument approach procedure which utilizes lateral guidance but does not utilizes vertical guidance.

PRECISION APPROACH (PA) PROCEDURE :

An instrument approach procedure using precision lateral and vertical guidance with minima as determined by the category of operation

APPROACH PROCEDURE WITH VERTICAL GUIDANCE (APV) :

An instrument procedure which utilizes lateral and vertical guidance but does not meet the requirements established for precision approach and landing operations.

NOTE: Lateral and vertical guidance refer to the guidance provided either by :

- a) a ground-based navigation aids; or
- b) a computer-generated navigation data .
 - Pilots may deviate from a published instrument approach procedure, if, visual reference is established before the completion of the instrument approach procedure and the aircraft is cleared for a visual approach.

VISUAL APPROACH :

An approach by an IFR flight when either part or all of an instrument approach procedure(I.A.P) is not completed and the approach is executed in visual reference to terrain.

INITIAL APPROACH SEGMENT :

That segment of instrument approach procedure between the initial approach fix (I.A.F) and the intermediate approach fix (I.F) or, where applicable, the final approach fix or point (F.A.F).

LOCATION INDICATOR :

A four-letter code group formulated in accordance with rules prescribed by ICAO and assigned to the location of an aeronautical fixed station.

MINIMUM FUEL :

The term used to describe a situation in which an aircraft's fuel supply has reached a state where little or no delay can be accepted.

NOTE : This is not an emergency situation but merely indicates that an emergency situation is possible, should any undue delay occur.

OPERATIONAL CONTROL :

The exercise of authority over the initiation, continuation, diversion or termination of a flight in the interest of the safety of the aircraft and the regularity and efficiency of the flight.

OPERATOR :

A person, organization or enterprise engaged in or offering to engage in an aircraft operation.

MISSED APPROACH PROCEDURE :

> The procedure to be followed if the approach cannot be continued .

(Missed approach procedure with required climb gradient)

NOTAM :

A notice distributed by means of telecommunication containing information concerning the establishment, condition or change in any aeronautical facility, service, procedure or hazard, the timely knowledge of which is essential to personnel concerned with flight operations.

`` NO FLIGHT MAY BE COMMENCED UNLESS THERE IS REASONABLE ASSURANCE THAT THE FACILITIES AND SERVICES REQUIRED FOR THE FLIGHT ARE AVAILABLE AND OPERATIONAL ``

NOTAM OFFICE :

Designated by the state for the exchange of NOTAM internationally, issuance and receipt of NOTAM by telecommunication, connected to the ACC, FIC and aerodrome, and staffed on a 24-hours basis.
If there is sufficient time for information to be disseminated by other means, a NOTAM is not issued. The time limit is 7 days.

OBSTACLE CLEARANCE ALTITUDE (OCA) OR OBSACLE CLEARANCE (OCH) :

The lowest altitude or the lowest height above the elevation of the relevant runway threshold or the aerodrome elevation as applicable, used in establishing compliances with appropriate obstacle clearance criteria.

NOTE 1 : OCA is referenced to mean sea level and OCH is referenced to the threshold elevation .

NOTE 2 : In the case of non-precision approaches, the OCH is referenced to the aerodrome elevation or the threshold elevation if that is more than 2m (7ft) below the aerodrome elevation.

NOTE 3 : An obstacle clearance height(**OCH**) for circling approach is referenced to the aerodrome elevation .

PILOT-IN-COMMAND :

The pilot designated by the operator, or in the case of general aviation, the owner, as being in command and charged with the safe conduct of a flight.

VECTORING :

Provision of navigational guidance to aircraft in the form of specific heading, based on the use of an ATS surveillance system.

RADAR APPROACH :

An approach in which the final phase is executed under the direction of a controller using radar.

PRECISION APPROACH RADAR (PAR) :

Primary radar equipment used to determine the position of an aircraft during final approach, in terms of lateral, and vertical deviations relative to a nominal approach path, and in range relative to touchdown.

RADAR CONTACT :

The situation which exists when the radar position of a particular aircraft is seen and identified on a situation display.

NOTE : the primary reason for use of Radar in ATC `` separation``.

PROCEDURE TURN :

A maneuver in which a turn is made away from a designated track followed by a turn in the opposite direction to permit the aircraft to intercept and proceed along the reciprocal of the designated track.

NOTE 1 : Procedure turns are designated "left" or "right" according to the direction of the initial turn .

NOTE 2 : Procedure turns may be designated as being made either in level flight or while descending, according to the circumstances of each individual procedure .

(Right procedure turn, 045°/180°)

(Right procedure turn, 080°/260°)

SIGNIFICANT POINT :

A specified geographical location used in defining an ATS route or the flight path of an aircraft and for other navigation and ATS purposes.

REPORTING POINT :

A specified geographical location in relation to which the position of an aircraft can be reported.

WAYPOINT (WPT) :

A specified geographical location used to define an area navigation route (R-NAV) or the flight path of an aircraft employing area navigation.

(Significant/Reporting and waypoint specified in ATS and R-NAV route)

Waypoints are defined as either :

a) Fly-by waypoint : A waypoint which requires turn anticipation to allow tangential interception of the next segment of a route or procedure; or

b) Flyover waypoint : A waypoint at which a turn is initiated in order to join the next segment of a route or procedure .

RUNWAY HOLDING POSITION :

- > A designated position intended to :
- a) to protect a runway;
- b) an obstacle limitation surface; and
- c) ILS critical/ sensitive area;
 - > at which taxiing aircraft and vehicles shall stop and hold, unless otherwise authorized by the aerodrome control tower.

NOTE : In radiotelephony phraseology, the expression "holding point" is used to designate the runway-holding position .

THRESHOLD:

The beginning of that portion of the runway usable for landing.

TOUCHDOWN:

> The point where the nominal glide path intercept the runway

TOUCHDOWN ZONE ELEVATION (TDZE):

> The highest elevation in the first 3000 feet of the landing surface.

RUNWAY VISUAL RANGE (RVR) :

The range over which the pilot of an aircraft on the center line of a runway can see the runway surface markings or the lights delineating the runway or identifying its center line.

SIGMET INFORMATION :

Information issued by a meteorological watch office concerning the occurrence or expected occurrence of specified en-route weather phenomena which may affect the safety of aircraft operation.

SNOW (ON THE GRUOND) :

- a) Dry snow- Specific gravity : up to but not including 0.35
- b) Wet snow- Specific gravity : 0.35 up to but not including 0.5
- c) Compacted snow- Specific gravity : 0.5 and over

SLUSH :

Water-saturated snow which with a heel-and-toe slap-down motion against the ground will be displaced with a splatter; specific gravity : 0.5 up to 0.8

(STARs linking the points RABEM, ALRAM and TOTBO to I.A.F in Uromiyeh)

STOPWAY :

A defined rectangular area on the ground at the end of take-off run available prepared as a suitable area in which an aircraft can be stopped in the case of an abandoned (aborted) take-off.

TAXIING :

Movement of an aircraft on the surface of an aerodrome under its own power, excluding take-off and landing.

TAXIWAY:

A defined path on a land aerodrome established for the taxiing of aircraft and intended to provide a link between one part of the aerodrome and another. **Taxiways include:**

a) Aircraft stand taxi lane- A portion of an aerodrome designated as a taxiway and intended to provide access to aircraft stand only.

b) Apron taxiway- A portion of a taxiway system located on an apron and intended to provide a through taxi route across the apron.

c) Rapid exit taxiway- A taxiway connected to a runway at an acute angle and designed to allow landing aeroplanes to turn off at higher speed (max 60 knots) than are achieved on other exit taxiways thereby minimizing runway occupancy times .

NOTE 1: Acute angle means : not greater than 45, nor less than 25 degrees; the desirable angle is 30 degrees .

NOTE 2: Taxi speeds are typically from 5 to 20 knots (9 to 37km/h), not exceeding brisk walk .

(Taxi-ways layout in Doha, Qatar aerodrome with I.N.S coordinates)

TERMINAL CONTROL AREA (TMA) :

A control area normally established at the confluence of ATS routes in the vicinity of one or more major aerodromes.

TRACK :

The projection on the earth's surface of the path of an aircraft, the direction of which path at any point is usually expressed in degrees from north (true, magnetic or grid).

TRAFFIC AVOIDANCE ADVISE :

Advise provided by an air traffic service (ATS) unit specifying maneuvers to assist pilot to avoid a collision.

TRAFFIC INFORMATION :

Information issued by an air traffic service (ATS) unit to alert a pilot to other known or observed air traffic which may be in proximity to the position or intended route of flight and to help the pilot avoid a collision.

TRANSITION ALTITUDE :

The altitude at or below which the vertical position of an aircraft is controlled by reference to altitude.

TRANSITION LEVEL :

> The lowest flight level available for use above the transition altitude .

TRANSITION LAYER :

> The airspace between the transition altitude and the transition layer.

(END OF CHAPTER ONE – DEFENITIONS)

Chapter 2

(ATS SAFETY MANAGEMENT)

States shall ensure that the level of air traffic services (ATS) and communications, navigation and surveillance, as well as the ATS procedures applicable to the airspace or aerodrome concerned, are appropriate and adequate for maintaining an acceptable level of safety in the provision of ATS.

Chapter 3 :

(ATS SYSTEM CAPACITY AND AIR TRAFFIC FLOW MANAGEMENT)

Chapter 4 : (GENERAL PROVISIONS FOR AIR TRAFFIC SERVICES)

RESPONSIBILITY FOR THE PROVISION OF AIR TRAFFIC CONTROL SERVICE:

> Area control service : Area control service shall be provided:

- a) by an area control center (ACC); or
- b) by the unit providing approach control service .
 - > Approach control service : Approach control service shall be provided:
- a) by an aerodrome control tower or an ACC, or
- b) by an approach control unit .
 - Aerodrome control service : Aerodrome control service shall be provided by an aerodrome control tower.

DIVISION OF RESPONSIBILITY FOR CONTROL BETWEEN AIR TRAFFIC CONTROL UNITS :

Arriving aircraft:

Control of an arriving aircraft shall be transferred from approach control unit to aerodrome control tower when the aircraft:

a) is in the vicinity of the aerodrome, and

b) it is considered that approach and landing will be completed in visual reference to the ground, or

c) has reached uninterrupted visual meteorological conditions, or

d) has landed

Departing aircraft :

Control of a departing aircraft shall be transferred from control tower to approach control :

A) when VMC CONDITIONS :

- 1) prior to the time the aircraft leaves the vicinity of the aerodrome,
- 2) prior to the time aircraft entering instrument meteorological conditions,

B) when IMC CONDITIONS :

immediately after the aircraft is airborne,

Between approach control unit and area control center(ACC):

- a unit providing approach control service shall be responsible for the control of:
- a) arriving aircraft that have been released to it by the ACC;
- b) departing aircraft until such aircraft are released to the ACC

FLIGHT PLAN :

A flight plan form should be provided and should be used by operators and air traffic services units for the purpose of completing flight plans.

The flight plan form should be printed and should include an English text in addition to the language(s) of the State concerned.

An operator shall, prior to departure:

a) ensure that, where the flight is intended to operate on a route or in an area where an RNP type is prescribed, the aircraft has an appropriate RNP approval, and that all conditions applying to that approval will be satisfied;

b) ensure that, where operation in reduced vertical separation minimum (RVSM) airspace is planned, the aircraft has the required RVSM approval .

Submission of a flight plan :

A) PRIOR TO DEPARTURE :

- > Flight plan shall not be submitted more than 120 hours before the EOBT.
- Except when RPL, a flight plan submitted prior to departure should be submitted to the air traffic services reporting office (ARO) at the departure aerodrome.
- If no such unit exists at the departure aerodrome, the flight plan should be submitted to the unit serving or designated to serve the departure aerodrome.
- In the event of a delay of 30 minutes in excess of the estimated off-block time (EOBT) for a controlled flight or a delay of one hour for an uncontrolled flight for which a flight plan has been submitted, the flight plan should be amended or a new flight plan submitted and the old flight plan cancelled, whichever is applicable.

Instructions for the completion of the flight plan form-

- > Adhere closely to the prescribed formats and manner of specifying data.
- Commence inserting data in the first space provided. Where excess space is available, leave unused spaces blank.
- > Insert all clock times in 4 figures UTC.
- Insert all estimated elapsed times in 4 figures (hours and minutes).
- Shaded area preceding Item 3 to be completed by ATS and COM services, unless the responsibility for originating flight plan messages has been delegated.

NOTE : Item numbers on the form are not consecutive, as they correspond to Field Type numbers in ATS messages.

Instructions for insertion of ATS data :

ITEM 7: AIRCRAFT IDENTIFICATION USED AS CALL SIGN (MAXIMUM 7 CHARACTERS) -

a) registration marking of the aircraft (e.g. EIAKO)

b) the ICAO designator for the aircraft operating agency followed by the flight identification (e.g. KLM511)

NOTE : When the aircraft is not equipped with radio, use registration marking as call sign .

ITEM 8 : FLIGHT RULES AND TYPE OF FLIGHT (ONE OR TWO CHARACTERS) -

Flight rules : I if IFR/ V if VFR/ Y if IFR first/ Z if VFR first

NOTE : specify in Item 15 the point or points where a change of flight rules is planned.

- Change from IFR flight to VFR flight is only acceptable when a message initiated by the pilot-in-command containing the specific expression "CANCELLING MY IFR FLIGHT", together with the changes, if any, to be made to the current flight plan.
- No reply, other than the acknowledgment "IFR FLIGHT CANCELLED AT ... (time)", should normally be made by an air traffic services unit.

Type of flight :S if scheduled air service/N if non-scheduled airtransport operation /G if general aviation /M if military /X ifother than any of the defined categories above.

ITEM 9: NUMBER AND TYPE OF AIRCRAFT AND WAKE TURBULENCE CATEGORY -

Number of aircraft (1 or 2 characters) : INSERT the number of aircraft, if more than one.

Type of aircraft (2 to 4 characters) :

- INSERT the appropriate designator as specified by ICAO OR,
- if no such designator has been assigned, or in case of formation flights comprising more than one type, INSERT ZZZZ, and SPECIFY in Item 18, the numbers and type(s) of aircraft preceded by TYP/

Wake turbulence category (1 character) :

- H HEAVY, to indicate an aircraft type with a maximum certificated takeoff mass of 136, 000 kg or more;
- M MEDIUM, to indicate an aircraft type with a maximum certificated take-off mass of less than 136, 000 kg but more than 7 000 kg;
- L LIGHT, to indicate an aircraft type with a maximum certificated takeoff mass of 7, 000 kg or less.

NOTE 1 : For aircraft in the heavy wake turbulence category the word "Heavy" shall be included immediately after the aircraft call sign in the initial radiotelephony contact between such aircraft and ATS units .

NOTE 2: Wake turbulence begins when, The nose wheel lift off the runway, and, ends, when The nose wheel touches down the runway.

ITEM 10: EQUIPMENT -

Radio communication, navigation and approach aid equipment :

- INSERT one letter as follows:
- N if no COM/NAV/approach aid equipment for the route to be flown is carried, or the equipment is unserviceable, or
- S if standard COM/NAV/approach aid equipment for the route to be flown is carried and serviceable

NOTE : Standard equipment is considered to be VHF RTF, ADF, VOR and ILS, unless another combination is prescribed by the appropriate ATS authority.

• INSERT one or more of the following letters to indicate the COM/NAV/ approach aid equipment available and serviceable:

A, (Not allocated) / B, (Not allocated) / C, LORAN C / D, DME / E, (Not allocated) / F, ADF / G, (GNSS) / H, HF RTF / I, Inertial Navigation / J (Data Link) / K (MLS) / L ILS / M Omega / O VOR / P (Not allocated) / Q (Not allocated) / R RNP type certification / T TACAN / U UHF RTF /

V VHF RTF / W,X,Y (when prescribed by ATS) / Z Other equipment /

NOTE 1: If the letter Z is used, specify in Item 18 the other equipment carried, preceded by COM/ and/or NAV/, as appropriate.

NOTE 2: Information on navigation capability is provided to ATC for clearance and routing purposes.

NOTE 3: Inclusion of letter **R** indicates that an aircraft meets the RNP type prescribed for the route segment(s), route(s) and/or area concerned.

Surveillance equipment : INSERT one or two of the following letters to describe the serviceable surveillance equipment carried:

SSR equipment :

N Nil / A Transponder — Mode A (4 digits — 4 096 codes) / C Transponder — Mode A (4 digits — 4 096 codes) and Mode C / X Transponder — Mode S without both aircraft identification and pressure-altitude transmission/

P Transponder — Mode S, including pressure-altitude transmission, but no aircraft identification transmission / I Transponder — Mode S, including aircraft identification transmission, but no pressure-altitude transmission /

S Transponder — Mode S, including both pressure altitude and aircraft identification transmission/

ITEM 13: DEPARTURE AERODROME AND TIME (8 CHARACTERS) –

- INSERT the ICAO four-letter location indicator of the departure aerodrome OR ;
- if no location indicator has been assigned, INSERT ZZZZ and SPECIFY, in Item 18, the name of the aerodrome preceded by DEP/

• THEN, WITHOUT A SPACE, INSERT for a flight plan submitted before departure, the estimated off-block time(EOBT).

Slot : The period of validity between, before, and, after calculated take-off time (C.T.O.T), and this period is for 15 minutes .

For example, if your EOBT Is at 14:00 UTC, the earliest time of takeoff (brake release at the start of the takeoff run) is 13:55 and latest 14:10.

ITEM 15: ROUTE -

• INSERT the first cruising speed as in (a) and the first cruising level as in (b), without a space between them, THEN;

following the arrow, INSERT the route description as in (c).

a) Cruising speed (maximum 5 characters) : INSERT the True Air Speed for the first or the whole cruising portion of the flight, in terms of:

- Kilometers per hour, expressed as K followed by 4 figures (e.g. K0830),
- Knots, expressed as N followed by 4 figures (e.g. N0485), or
- Mach number, to the nearest hundredth of unit Mach, expressed as M followed by 3 figures (e.g. M082).

(b) Cruising level (maximum 5 characters): INSERT the planned cruising level for the first or the whole portion of the route, in terms of:

- Flight level, expressed as F followed by 3 figures (e.g. F085; F330), or
- Standard Metric Level in tens of meters, expressed as S followed by 4 figures (e.g. S1130), or
- Altitude in hundreds of feet, expressed as A followed by 3 figures (e.g. A045; A100), or
- Altitude in tens of meters, expressed as M followed by 4 figures (e.g. M0840), or
- for uncontrolled VFR flights, the letters VFR.

(c) Route (including changes of speed , level or flight rules) :

Flights along designated ATS routes : INSERT,

- if the departure aerodrome is located on or connected to the ATS route, the designator of the first ATS route ,OR ;
- if the departure aerodrome is not on or connected to the ATS route, the letters DCT followed by the point of joining the first ATS route, followed by the designator of the ATS route , THEN;
- INSERT each point at which either a change of speed or level, a change of ATS route, and/or a change of flight rules is planned,

FOLLOWED IN EACH CASE :

- by the designator of the next ATS route segment, even if the same as the previous one, OR ;
- by DCT, if the flight to the next point will be outside a designated route, unless both points are defined by geographical coordinates.

ITEM 16: DESTINATION AERODROME AND TOTAL ESTIMATED ELAPSED TIME, DESTINATION ALTERNATE AERODROME(S) -

Destination aerodrome and total estimated elapsed time (8 characters) :

- INSERT the ICAO four-letter location indicator of the destination aerodrome followed, without a space, by the total estimated elapsed time , OR;
- if no location indicator has been assigned, INSERT ZZZZ followed, without a space, by the total estimated elapsed time, and SPECIFY in Item 18 the name of the aerodrome, preceded by DEST/.

NOTE : For a flight plan received from an aircraft in flight, the total estimated elapsed time is the estimated time from the first point of the route to which the flight plan applies.

Destination Alternate aerodrome(s) (4 characters) :

- INSERT the ICAO four-letter location indicator(s) of not more than two alternate aerodromes, separated by a space ,OR ;
- if no location indicator has been assigned to the alternate aerodrome, INSERT ZZZZ and SPECIFY in Item 18 the name of the aerodrome, preceded by ALTN/.

NOTE : At least one destination alternate aerodrome should be inserted in flight plan .

ITEM 18: OTHER INFORMATION -

- INSERT 0 (zero) if no other information, OR ;
- any other necessary information in the preferred sequence shown hereunder, in the form of the appropriate indicator followed by an oblique stroke and the information to be recorded:
- **EET/** Significant points or **FIR boundary** designators
- **REG/** The registration markings of the aircraft, **if different from** the aircraft identification in Item 7.
- OPR/ Name of the operator, if not obvious from the aircraft identification in Item 7.
- **FFR/** fire-fighting
- HOSP/ for a medical flight
- **DEST/** Name of destination aerodrome, if ZZZZ is inserted in Item 16.
- **RMK/ Any other** plain language remarks when required By the appropriate ATS authority or deemed necessary.

ITEM 19: SUPPLEMENTARY INFORMATION -

Endurance :

• After E/ INSERT a 4-figure group giving the fuel endurance in hours and minutes.

Persons on board :

- After P/ INSERT the total number of persons (passengers and crew) on board, when required by the appropriate ATS authority.
- INSERT TBN (to be notified) if the total number of persons is not known at the time of filing.

NOTE : Information submitted prior to departure regarding fuel endurance or total number of persons carried on board, if incorrect at time of departure, constitutes a significant change to the flight plan and as such must be reported.

Emergency and survival equipment -

R/ (RADIO) :

• CROSS OUT U if UHF on frequency 243.0 MHz is not available. CROSS OUT V if VHF on frequency 121.5 MHz is not available. CROSS OUT E if emergency locator transmitter (ELT) is not available.

S/ (SURVIVAL EQUIPMENT) :

- **CROSS OUT all indicators if survival equipment is not carried.**
- CROSS OUT P if polar equipment is not carried.
- CROSS OUT D if desert survival equipment is not carried.
- CROSS OUT M if maritime survival equipment is not carried.
- CROSS OUT J if jungle survival equipment is not carried.

J/ (JACKETS) :

- CROSS OUT all indicators if life jackets are not carried.
- CROSS OUT L if life jackets are not equipped with lights.
- CROSS OUT F if life jackets are not equipped with fluorescein.
- CROSS OUT U or V or both as in R/above to indicate radio capability of jackets, if any.

D/ (DINGHIES) -

(NUMBER):

• CROSS OUT indicators D and C if no dinghies are carried, or INSERT number of dinghies carried; and

(CAPACITY) :

• INSERT total capacity, in persons, of all dinghies carried; and

(COVER):

• **CROSS OUT** indicator **C** if dinghies are not covered; and

(COLOUR):

• **INSERT color** of dinghies if carried.

A/ (AIRCRAFT COLOUR AND MARKINGS) :

• INSERT color of aircraft and significant markings.

N/ (REMARKS) :

• CROSS OUT indicator N if no remarks, or INDICATE any other survival equipment carried and any other remarks regarding survival equipment.

NOTE : When any type of emergency and survival equipment is not available, we must cross out the relevant Item in FPL .

C/(PILOT):

• INSERT name of pilot-in-command.

Filed by :

• INSERT the name of the unit, agency or person filing the flight plan.

AIR TRAFFIC CONTROL CLEARANCES :

- Clearances are issued solely for expediting, separating and an orderly flow of air traffic and are based on known traffic conditions.
- Such traffic conditions include not only aircraft in the air and on the manoeuvring area, but also any vehicular traffic or other obstructions not permanently installed on the manoeuvring area in use.
- If an air traffic control clearance is not suitable to the pilot-in-command of an aircraft, the flight crew may request and, if practicable, obtain an amended clearance.
- When a flight plan specifies that the first portion of a flight will be subject to ATC, and that the subsequent portion will be uncontrolled, the aircraft shall normally be cleared to the point at which the controlled flight terminates.

Note : Clearances do not relieve pilots from compliance with the rules.

Flights through intermediate stops :

- When an aircraft files, at the departure aerodrome, flight plans for the flight through intermediate stops, the initial clearance limit will be the first destination aerodrome and new clearances shall be issued for each subsequent portion of flight.
- The flight plan for the second stage, and each subsequent stage, of a flight through intermediate stops will become active only when the appropriate ATS unit has received notification that the aircraft has departed from the relevant departure aerodrome.

Standard clearances for departing aircraft shall contain the following items:

a) aircraft identification; b) clearance limit, normally destination aerodrome; c) designator of the assigned SID, if applicable; d) initial level, except when this element is included in the SID description; e) allocated SSR code; f) any other necessary instructions or information.

Clearance for En-route aircraft :

- The phrase "cleared via flight planned route" may be used to describe any route provided the route is identical to that filed in the flight plan and sufficient routing details are given to definitely establish the aircraft on its route.
- The phrases "cleared via (designation) departure" or "cleared via (designation) arrival" may be used when standard departure or arrival routes have been established by the appropriate ATS authority and published in Aeronautical Information Publications (AIPs).
- A clearance limit shall be described by specifying the name of the appropriate significant point, or aerodrome, or controlled airspace boundary. (clearance limit, is normally destination aerodrome).

Clearance for En-route aircraft :

- The phrase "cleared via flight planned route" may be used to describe any route provided the route is identical to that filed in the flight plan and sufficient routing details are given to definitely establish the aircraft on its route.
- The phrases "cleared via (designation) departure" or "cleared via (designation) arrival" may be used when standard departure or arrival routes have been established by the appropriate ATS authority and published in Aeronautical Information Publications (AIPs).

- A clearance limit shall be described by specifying the name of the appropriate significant point, or aerodrome, or controlled airspace boundary. (clearance limit, is normally destination aerodrome).
- When traffic conditions will not permit clearance of a requested change, the word "UNABLE" shall be used. When warranted by circumstances, an alternative route or level should be offered.

READ-BACK OF CLEARANCES :

The flight crew shall read back to the air traffic controller safety-related parts of ATC clearances and instructions which are transmitted by voice.

The following items shall always be read back:

a) ATC route clearances; b) clearances and instructions to enter, land on, take off from, hold short of, cross taxi and backtrack on any runway; c) runway-in-use, altimeter settings, SSR codes, level instructions, heading and speed instructions and, whether issued by the controller or contained in ATIS broadcasts, transition levels.

NOTE : If the level of an aircraft is reported in relation to standard pressure,

1013.2 hPa, the words "FLIGHT LEVEL" precede the level figures. If the level of the aircraft is reported in relation to QNH/QFE, the figures are followed by the word "METRES" or "FEET", as appropriate.

- Other clearances or instructions, including conditional clearances, shall be read back or acknowledged in a manner to clearly indicate that they have been understood and will be complied with.
- The controller shall listen to the read-back to ascertain that the clearance or instruction has been correctly acknowledged by the flight crew and shall take immediate action to correct any discrepancies revealed by the read-back.

HORIZONTAL SPEED CONTROL INSTRUCTIONS :

- In order to facilitate a safe and orderly flow of traffic, aircraft may be instructed to adjust speed in a specified manner and Flight crews should be given adequate notice of planned speed control.
- Speed control shall not be applied to aircraft entering or established in a holding pattern.
- Speed adjustments should be limited to those necessary to establish and/or maintain a desired separation minimum or spacing.
- The flight crew shall inform the ATC unit concerned if at any time they are unable to comply with a speed instruction.
- Aircraft shall be advised when a speed control restriction is no longer required.

Descending and arriving aircraft :

- An aircraft should, when practicable, be authorized to absorb a period of notified terminal delay by cruising at a reduced speed for the last portion of its flight.
- An arriving aircraft may be instructed to maintain its "maximum speed", "minimum clean speed", "minimum speed", or a specified speed.

NOTE : "Minimum clean speed" signifies the minimum speed at which an aircraft can be flown in a clean configuration, i.e. without deployment of lift-augmentation devices, speed brakes or landing gear.

- Speed reductions to less than 460 km/h (250 knots) IAS for turbojet aircraft during initial descent from cruising level should be applied only with the concurrence of the flight crew.
- Below 4, 550 m (FL 150), speed reductions for turbojet aircraft to not less than 410 km/h (220 knots) IAS, may be used.

- Only minor speed reductions not exceeding plus/minus 40 km/h (20 knots) IAS should be used for aircraft on intermediate and final approach.
- Speed control should not be applied to aircraft after passing a point 7 km (4 NM) from the threshold on final approach.

ALTIMETER SETTING PROCEDURES :

Expression of vertical position of aircraft :

- For flights in the vicinity of aerodromes and within terminal control areas the vertical position of aircraft Shall be expressed in terms of altitudes at or below the transition altitude and in terms of flight levels at or above the transition level.
- While passing through the transition layer, vertical position shall be expressed in terms of flight levels when climbing and in terms of altitudes when descending.

Determination of the transition level :

- The appropriate ATS unit shall establish the transition level to be used in the vicinity of the aerodrome(s) concerned and, the terminal control area (TMA) concerned, for the appropriate period of time on the basis of QNH reports.
- When an aircraft using atmospheric pressure at aerodrome elevation (QFE), the vertical position of the aircraft shall be expressed in terms of height above aerodrome, except that it shall be expressed in terms of height above runway threshold elevation:

a) for instrument runways, if the threshold is 2 meters(7 feet) or more below the aerodrome elevation, and

b) for precision approach runways.

- For flights en route the vertical position of aircraft shall be expressed in terms of:
- a) flight levels at or above the lowest usable flight level;
- b) altitudes below the lowest usable flight level;
 - The transition level shall be the lowest flight level available for use above the transition altitude established for the aerodrome(s) concerned.

Minimum cruising level for IFR flights :

- Except when specifically authorized by the appropriate authority, cruising levels below the minimum flight altitudes established by the State, shall not be assigned.
- Unless otherwise prescribed by the State concerned, the lowest usable flight level is that flight level which corresponds to, or is immediately above, the established minimum flight altitude.

(IFR flight shall not fly at cruising level, less than specified by the state)

- Unless otherwise prescribed by the State concerned, the lowest usable flight level is that flight level which corresponds to, or is immediately above, the established minimum flight altitude.
- The objectives of the air traffic control service do not include prevention of collision with terrain.
- The procedures prescribed do not therefore relieve the pilots of their responsibility to ensure that any clearance issued by air traffic control units is safe, except, when an IFR flight is vectored by radar.

Provision of altimeter setting information :

- The flight crew shall be provided with the transition level in due time prior to reaching it during descent.
- This may be accomplished by voice communications, ATIS broadcast data link, included in approach clearances or requested by the pilot.

A QNH altimeter setting shall be included in the descent clearance, in approach clearances or clearances to enter the traffic circuit, and in taxi clearances for departing aircraft, except when it is known that the aircraft has already received the information.

POSITION REPORTING :

- On routes defined by designated significant points, position reports shall be made by the aircraft when over, or as soon as possible after passing, each designated compulsory reporting point.
- the operational normal shall be made 20 to 40 minutes after the last contact.
- On routes not defined by designated significant points, position reports shall be made by the aircraft as soon as possible after the first half hour of flight and at hourly intervals thereafter.
- flights may be exempted from the requirement to make position reports at each designated compulsory reporting point or interval, when :
- a) Notified by ATC `` Radar contact`` which means seen and identified, or
- b) `` Next report `` is assigned by ATC unit, and
- c) Advised by ATC `` omit position report until ``.....`` .

Contents of voice position reports :

- 1) aircraft identification ;2) position ;3) time ;
- 4) flight level or altitude, including passing level and cleared level
- 5) next position and time over 6) ensuing significant point.

NOTE : When assigned a speed to maintain, the flight crew shall include this speed in their position reports.

Example of position report of an aircraft over Rasht at time 19:23 maintaining FL 280 routing to Zanjan(ETA, 19:34) then Uromiyeh :

`` TEHRAN CONTROL, AIR FORCE 8960, POSITION ROMEO SEIRA TANGO, AT TIME 19:23, FLIGHT LEVEL TWO EIGHT ZERO, NEXT POSITION ZULU ALFA JULEIT AT TIME 19:34, UNIFORM MIKE HOTEL NEXT ``

REPORTING OF METEOROLOGICAL INFORMATION :

1) air temperature2) wind direction3) wind speed

4) turbulence

5) aircraft icing

6) humidity

0 RA N37 03 269 0 $\mathcal{I}(R)$ 30.3 N37 26.2 F045 Comp

(``M`` Represents meteorological reporting station)

Contents of special air-reports :

Special air-reports shall be made by all aircraft whenever the following conditions are encountered or observed:

a) severe turbulence; or b) severe icing; or c) severe mountain wave; or

d) thunderstorms, without hail that are obscured, embedded, widespread or in squall-lines; or
e) thunderstorms, with hail that are obscured, embedded, widespread or in squall-lines; or
f) heavy dust storm or heavy sandstorm; or
g) valcanic ash cloud; or

g) volcanic ash cloud; or
h) pre-eruption volcanic activity or a volcanic eruption.

(END OF CHAPTER FOUR)

CHAPTER 5. SEPARATION METHODS AND MINIMA -

- Chapter 5 contains procedures and non-radar separation minima for use in the separation of aircraft in the en route phase as well as aircraft in the arrival and departure phases of flight.
- the controlled IFR flight separation methods applied by ATC are, Vertical, horizontal and composite separation.

NOTE : Composite separation is only applied on the basis of regional air navigation agreements.

SEPARATION OF CONTROLLED TRAFFIC :

- Vertical or horizontal separation shall be provided:
- a) between all flights in Class A and B airspaces;
- b) between IFR flights in Class C, D and E airspaces;
- c) between IFR flights and VFR flights in Class C airspace;
- d) between IFR flights and special VFR flights; and
- e) between special VFR flights,

Vertical separation minimum :

The vertical separation minimum (VSM) shall be:

a) A nominal 300 m (1,000 ft) below FL 290 and a nominal 600 m (2,000 ft) at or above this level, except, within RVSM airspace , a 300 m (1,000 ft) below FL 410, and a 600 m (2,000 ft) at or above this level.

- The cruising levels to be assigned to controlled flights shall be selected from those allocated to IFR flights as :
- a) For course from 000 to 179 degrees, select an odd level, and ;
- b) For course from 180 to 359 degrees, select an even level, except that;

the correlation of levels to track shall not apply whenever indicated in air traffic control clearances, using the word `` wrong level`` or specified by the appropriate ATS authority in AIPs.

(``E`` Indicates correlation shall not apply, as specified by ATS authority)

NON-RADAR WAKE TURBULENCE LONGITUDINAL SEPARATION MINIMA :

The ATC unit concerned shall not be required to apply wake turbulence separation:

a) for arriving VFR flights landing on the same runway as a preceding landing HEAVY or MEDIUM aircraft; and

b) between arriving IFR flights executing visual approach when the aircraft has reported the preceding aircraft in sight and has been instructed to follow and ``maintain own separation`` from that aircraft.

- The pilot-in-command of the aircraft concerned shall be responsible for ensuring that the spacing from a preceding aircraft of a heavier wake turbulence category is acceptable.
- If it is determined that additional spacing is required, the flight crew shall inform the ATC unit accordingly, stating their requirements.

Separation for arriving aircraft :

- The following minima shall be applied to aircraft landing behind a HEAVY or a MEDIUM aircraft:
- a) MEDIUM aircraft behind HEAVY aircraft 2 minutes;
- b) LIGHT aircraft behind a HEAVY or MEDIUM aircraft 3 minutes.

Separation of departing aircraft :

- A minimum separation of 2 minutes shall be applied between a LIGHT or MEDIUM aircraft taking off behind a HEAVY aircraft or a LIGHT aircraft taking off behind a MEDIUM aircraft.
- A separation minimum of 3 minutes shall be applied between a LIGHT or MEDIUM aircraft when taking off behind a HEAVY aircraft or a LIGHT aircraft when taking off behind a MEDIUM aircraft from an intermediate part of the same runway.
- Reduced runway separation minima shall only be applied during the hours of daylight from 30 minutes after local sunrise to 30 minutes before local sunset.
- A landing aircraft Is not normally permitted to cross the beginning of the runway on its final approach until the preceding departing aircraft has become airborne and crossed the end of the runway threshold.
- separation minima shall not apply to aircraft operating under military necessity and formation flights.

ESSENTIAL TRAFFIC :

- Essential traffic is that controlled traffic to which the provision of separation by ATC is applicable.
- ATC is required to provide separation between IFR flights in airspace Classes A to E, and between IFR and VFR flights in Classes B and C.
A VFR flight would not constitute essential traffic to other VFR flights except within Class B airspace.

SEPARATION IN THE VICINITY OF AERODROMES :

- > the separation minima may be reduced in the vicinity of aerodromes if:
- a) when each aircraft is continuously visible to this controller; or
- b) pilots report that they can maintain their own separation; or

c) the flight crew of the succeeding aircraft reports that the other aircraft is in sight and separation can be maintained.

Standard clearances for departing aircraft shall contain :

- a) aircraft identification;
- b) clearance limit, normally destination aerodrome;
- c) designator of the assigned SID, if applicable;
- d) initial level, except when this element is included in the SID description;
- e) allocated SSR code;
- f) any other necessary instructions or information not contained in the SID .
 - an IFR en-route clearance stating: ``Clearance expires at 08:15``, it mean that, If not airborne until 08:15 a new clearance has to be issued.
 - Departing aircraft may be expedited by suggesting a take-off direction which is not into the wind. It is the responsibility of the pilot-in-command of an aircraft to decide between making such a take-off or waiting for take-off in a preferred direction.
 - If departures are delayed, the delayed flights shall normally be cleared in an order based on their estimated time of departure.
 - Air traffic control units should, when practicable, advise aircraft operators or their designated representatives when anticipated delays are expected to exceed 30 minutes.

- Information regarding significant changes in the meteorological conditions in the take-off or climb-out area, obtained by Approach control, shall be transmitted to the departing aircraft without delay, except when it is known that the aircraft already has received the information.
- an IFR en-route clearance stating: ``Clearance expires at 08:15``, it mean that, If not airborne until 08:15, a new clearance has to be issued.

PROCEDURES FOR ARRIVING AIRCRAF:

arriving aircraft should normally be cleared to follow the appropriate STAR. The aircraft shall be informed of the type of approach to expect and runway-in-use as early as possible.

Standard clearances for arriving aircraft shall contain :

- a) aircraft identification;
- b) designator of the assigned STAR;
- c) runway-in-use, except when part of the STAR description;
- d) initial level, except when this element is included in the STAR description;
- e) other necessary instructions or information not contained in the STAR .

Visual approach :

- Clearance for an IFR flight to execute a visual approach may be requested by a flight crew or initiated by the controller.
- An IFR flight may be cleared to execute a visual approach provided the pilot can maintain visual reference to the terrain and:

a) the reported ceiling is at or above the level of the beginning of the initial approach segment ; or

- b) the pilot reports that a visual approach and landing can be completed.
 - The pilot-in-command of the aircraft concerned shall be responsible for the spacing from a preceding aircraft.

Instrument approach :

The approach control unit shall specify the instrument approach procedure to be used by arriving aircraft, but flight crew may request an alternative procedure.

Holding :

> When delay is expected, the aircraft shall be cleared to the holding fix, and expected approach time shall be delivered.

Approach sequence :

a) An aircraft in a state of emergency, including being subjected to unlawful interference, shall be given priority over other aircraft .

b) Hospital aircraft or aircraft carrying any sick or seriously injured person requiring urgent medical attention;

c) Aircraft engaged in search and rescue operations

NOTE : If an aircraft enters an aerodrome traffic circuit without proper authorization, it shall be permitted to land if its actions indicate that it so desires

Expected approach time -

- An expected approach time shall be determined for an arriving aircraft that will be subjected to a delay of 10 minutes or more, not later than at the commencement of its initial descent from cruising level.
- A revised expected approach time shall be transmitted to the aircraft whenever differs from that previously transmitted by 5 minutes or more.

INFORMATION FOR ARRIVING AIRCRAFT :

As early as practicable after an aircraft has established communication with approach control service, the following information, in the order listed, shall be transmitted to the aircraft : type of approach and runway-in-use; meteorological information, as follows: surface wind direction and speed, including significant variations; visibility and, when applicable, RVR; present weather; cloud below 1 500 m (5 000 ft) or below the highest minimum sector altitude, whichever is greater; cumulonimbus; if the sky is obscured; air temperature; dew point temperature; altimeter setting(s); significant meteorological phenomena in the approach area; current runway surface conditions;

At the commencement of final approach :

- > significant changes in the mean surface wind direction and speed by :
- Mean headwind component: 19 km/h (10 kt)
- Mean tailwind component: 4 km/h (2 kt)
- Mean crosswind component: 9 km/h (5 kt)
- -wind shear and/or turbulence in the final approach area; if any

NOTE : Aircraft which fail to report after transferred to an aerodrome control tower, or, having reported, but, cease radio contact and fail to land five minutes after the expected landing time, shall be reported to the rescue coordination center .

UNCERTAINTY OF POSITION ON THE MANOEUVRING AREA :

- A pilot in doubt as to the position of the aircraft with respect to the manoeuvring area, shall immediately :
- a) stop the aircraft; and
- b) notify the ATS unit including the last known position .

> If recognizes that the aircraft is on a runway, the pilot shall immediately:

a) notify the ATS unit including the last known position ;

b) if able, vacate the runway as expeditiously as possible, unless otherwise instructed by the ATS unit; and then,

c) stop the aircraft.

- If the control tower is unable to determine, that an aircraft has cleared the runway, the aircraft shall be requested to report when it has vacated the runway.
- The report shall be made when the entire aircraft is beyond the relevant runway-holding position.
- Aircraft shall not be permitted to line up and hold on the runway-in-use until the landing aircraft has passed the point of intended holding.

PRIORITY ON THE MANOEUVRING AREA :

- All vehicles and pedestrians shall give way to aircraft which are landing, taxiing or taking off.
- emergency vehicles proceeding to the assistance of an aircraft in distress shall have priority over all other surface movement traffic .
- > An aircraft landing or in the final stages of an approach to land shall normally have priority over an aircraft intending to depart .
- On acceptance of `` clearance for immediate take-off ``, the aircraft shall taxi out to the runway and take off in one continuous movement.

AUTHORIZATION OF SPECIAL VFR FLIGHTS :

- When traffic conditions permit, special VFR flights may be authorized subject to the approval of the unit providing approach control service.
- Separation shall be effected between all IFR flights and special VFR flights and between all special VFR flights.
- When the ground visibility is not less than 1, 500 m, special VFR flights may be authorized to: enter a control zone for the purpose of landing, take off and depart from a control zone, cross a control zone or operate locally within a control zone.

Aircraft maintaining a level :

An aircraft is considered to be reached and maintaining its assigned level when it is within ±60 m (±200 ft) in RVSM airspace and ±90 m (±300 ft) in other airspaces.

Aircraft vacating/passing a level :

An aircraft is considered to have commenced its manoeuvre and vacated/crossed the previously occupied level when a change of more than 90 m (300 ft) in the anticipated direction from its previously assigned level.

pilots shall resume voice or CPDLC position reporting :

- a) when so instructed;
- b) when advised that the ATS surveillance service has been terminated; or
- c) when advised that identification is lost .

AIRCRAFT TRANSPONDER FAILURE :

- When an aircraft experiencing transponder failure after departure, the ATC units concerned should endeavor to provide for continuation of the flight to the aerodrome of first intended landing in accordance with the flight plan.
- when failure is detected shortly after take-off, The aircraft may then be required to return to the departure aerodrome or to land at the nearest suitable aerodrome.
- In case of a transponder failure which is detected before departure from an aerodrome where it is not practicable to effect a repair, the aircraft concerned should be permitted to proceed, as directly as possible, to the nearest suitable aerodrome where repair can be made.

Vectoring :

- Vectoring shall be achieved by issuing to the pilot specific headings which will enable the aircraft to maintain the desired track.
- when an aircraft is given its initial vector diverting it from a previously assigned route, the pilot shall be informed what the vector is to accomplish, and the limit of the vector shall be specified (e.g. to ... position, for ... approach);
- Prior to, or upon commencement of, vectoring for approach, the pilot shall be advised of the type of approach and the runway to be used.
- Aircraft vectored for final approach should be given a heading or a series of headings calculated to close with the final approach track (in level flight with the final approach track of 45 degrees or less).
- An aircraft making a radar approach should be directed to execute a missed approach if no clearance to land has been received from the controller by the time the aircraft reaches a distance of 4 km (2 NM) from touchdown.
- transmission should not be interrupted for intervals of more than five seconds while the aircraft is within a distance of 8 km (4 NM) from touchdown and the pilot shall be advised that no further acknowledgement of transmission is required.

Air traffic advisory service :

- The objective of the air traffic advisory service is to make information on collision hazards more effective than it would be in the flight information service.
- It may be provided to aircraft conducting IFR flights in advisory airspace or on advisory routes (Class F airspace).
- Air traffic advisory service does not afford the degree of safety and cannot assume the same responsibilities as air traffic control service.

- To make this quite clear, air traffic advisory service does not deliver "clearances" but only "advisory information" and it uses the word "advise" or "suggest" when a course of action is proposed to an aircraft.
- it is for the aircraft to decide whether or not it will comply with the advice or suggestion received and to inform air traffic advisory service.
- IFR flights intending to cross an advisory route should do so as nearly as possible at an angle of 90 degrees to the direction of the route and at a level, appropriate to its track.
- aircraft equipped with suitable two-way radio communications shall report during the period twenty to forty minutes following the time of last contact, to indicate that the flight is progressing according to plan, including identification of the aircraft and the words "Operations normal".
- When no report from an aircraft has been received, the ATS unit shall, within the period of thirty minutes, endeavor to obtain such report in order to apply the "Uncertainty Phase".

PHRASEOLOGIES (Chapter 12):

- Pilots and ATS personnel shall be thoroughly familiar with the radiotelephony procedures.
- Pilots and, ATS personnel will be expected to use plain language, which should be as clear and concise as possible, to the level specified in the ICAO language proficiency requirements.
- During operations in or vertical transit through RVSM airspace with aircraft not approved for RVSM operations, pilots shall report nonapproved status as follows :
- a) at initial call on any channel within RVSM airspace;
- b) in all requests for level changes; and
- c) in all read backs of level clearances .

Phrases, such as "behind landing aircraft" or "after departing aircraft", are considered as conditional clearances . for example:

"SAS 941, BEHIND DC9 ON SHORT FINAL, LINE UP BEHIND".

NOTE : This implies the need for the aircraft receiving the conditional clearance to identify the aircraft causing the conditional clearance .

	``(nosition in circuit e g DOW/NWIND)`		
	b) MAKELONG APPROACH		
	(or EXTEND DOWNWIND)		
	c) REPORT BASE (or FINAL		
	or LONG EINAL)		

NOTE : The report "LONG FINAL" is made when aircraft turn on to final approach at a distance greater than 7 km (4 NM) from touchdown or when an aircraft on a straight-in approach is 15 km (8 NM) from touchdown.

In both cases a report "FINAL" is required at 7 km (4 NM) from touchdown.

PROCEDURES FOR IN-FLIGHT CONTINGENCIES :

pilot shall advise ATC as soon as practicable, reminding them of the type of aircraft involved and the nature of the problem, then :

1) The radiotelephony distress signal (MAYDAY) or urgency signal (PAN PAN) preferably spoken three times shall be used as appropriate .

2) leave the assigned route or track by initially turning at least 45 degrees to the right or to the left, in order to acquire track offset 15 NM (28 km) from the assigned track center line .

3) if unable to maintain the assigned flight level, select a final altitude which differs from those normally used by 150 m (500 ft) if at or below FL 410, or by 300 m (1 000 ft) if above FL 410; or

4) If able to maintain the assigned flight level, once the aircraft has deviated 19 km (10 NM) from the assigned track center line, climb or descend to select a flight level which differs from those normally used by 150 m(500 ft), if at or below FL 410, or by 300 m (1 000 ft) if above FL 410.

5) Establish communications with and alert nearby aircraft by broadcasting, at suitable intervals on 121.5 MHz (or, as a backup, on the inter-pilot air-to-air frequency 123.45 MHz) and where appropriate on the frequency in use:

aircraft identification, flight level, position (including the ATS route designator) and intentions;

6) Maintain a watch for conflicting traffic both visually and by reference to ACAS (if equipped);

7) Turn on all aircraft exterior lights (commensurate with appropriate operating limitations); and

8) keep the SSR transponder on at all times .

Weather deviation procedures :

NOTE : The following procedures are intended for deviations around adverse meteorological conditions .

- When the pilot initiates communications with ATC, a rapid response may be obtained by stating "WEATHER DEVIATION REQUIRED" to indicate that priority is desired on the frequency and for ATC response.
- ➢ When necessary, the pilot should initiate the communications using the urgency call "PAN PAN" (preferably spoken three times).
- The pilot shall inform ATC when weather deviation is no longer required, or when a weather deviation has been completed and the aircraft has returned to its cleared route.

- where a pilot needs to exercise the authority of a pilot-in-command under provisions of Annex 2 (ATC CLEARANCE CANNOT BE OBTAINED) :
- a) If possible, deviate away from an organized track or route system;

b) Establish communications with and alert nearby aircraft by broadcasting, at suitable intervals: aircraft identification, flight level, position (including ATS route designator or the track code) and intentions, on the frequency in use and on 121.5 MHz (or, as a backup, on the inter-pilot air-to-air frequency 123.45 MHz);

c) watch for conflicting traffic both visually and by reference to ACAS (if equipped);

d) Turn on all aircraft exterior lights (commensurate with appropriate operating limitations);

e) For deviations of less than 19 km (10 NM) remain at a level assigned by ATC;

f) For deviations greater than 19 km (10 NM), when the aircraft is approximately 19 km (10 NM) from track, initiate a level change mentioned .

g) When returning to track, be at its assigned flight level when the aircraft is within approximately 19 km (10 NM) of the center line .

Strayed VFR flights and VFR flights encountering adverse meteorological conditions :

NOTE : A strayed aircraft is an aircraft which has deviated significantly from its intended track or which reports that it is lost .

A VFR flight reporting that it is uncertain of its position or lost, or encountering adverse meteorological conditions, should be considered to be in a state of emergency and handled as such.

Fuel dumping :

- An aircraft in an emergency or other urgent situations may need to dump fuel so as to reduce to maximum landing mass in order to effect a safe landing.
- When an aircraft operating within controlled airspace needs to dump fuel, the flight crew shall advise ATC.

> The ATC unit should coordinate with the flight crew the following:

a) The route to be flown, which, if possible, should be clear of cities and towns, preferably over water and away from areas where thunderstorms have been reported or are expected.

b) The level to be used, which should be not less than 1, 800 m (6, 000 ft); and;

c) The duration of the fuel dumping.

Other traffic should be **separated** from the aircraft dumping fuel by:

a) at least 19 km (10 NM) horizontally, but not behind the aircraft dumping fuel;

b) vertical separation if behind the aircraft dumping fuel within 15 minutes flying time or a distance of 93 km (50 NM) by :

- 1) at least 300 m (1, 000 ft) if above the aircraft dumping fuel; and
- 2) at least 900 m (3, 000 ft) if below the aircraft dumping fuel.

Fuel emergency and minimum fuel :

- When a pilot reports a state of minimum fuel, the controller shall inform the pilot as soon as practicable of any anticipated delays or that no delays are expected.
- This is not an emergency situation but an indication that an emergency situation is possible should any additional delay occur.

> The words MAYDAY FUEL describe the nature of the distress condition .

USE OF REPETITIVE FLIGHT PLANS (RPLs) :

- RPLs shall not be used for flights other than IFR flights operated regularly on the same day(s) of consecutive weeks and on at least ten occasions or every day over a period of at least ten consecutive days.
- RPLs shall cover the entire flight from the departure aerodrome to the destination aerodrome.
- The minimum lead time for submission of RPL shall be at least two weeks and operators shall submit listings.
- Changes of a permanent nature involving the inclusion of new flights shall be submitted in the form of amendment listings, at least seven days prior to the change becoming effective.
- Changes such as aircraft type and wake turbulence category, speed and/or cruising level shall be notified for each individual flight as early as possible and no later than 30 minutes before departure.
- In case of an incidental change in the aircraft identification, the departure aerodrome, the route and/or the destination aerodrome, the RPL shall be cancelled for the day concerned and an individual flight plan shall be submitted.
- Whenever it is expected by the operator that a specific flight, for which an RPL has been submitted, is likely to encounter a delay of 30 minutes or more in excess of the off-block time stated in that flight plan, the ATS unit responsible for the departure aerodrome shall be notified immediately.
- The operator shall ensure that the latest flight plan information, is made available to the pilot-in-command.

NOTIFICATION OF COMMUNICABLE DISEASES, OR OTHER PUBLIC HEALTH RISK, ON BOARD AN AIRCRAFT :

The flight crew of an en-route aircraft shall, upon identifying a suspected case(s) of communicable disease, or other public health risk, on board the aircraft, promptly notify the ATS unit with which the pilot is communicating.

THE END

(GOOD LUCK)

Class	Type of flight	Separation provided	Service provided	Speed limitation*	Radio com- munication requirement	Subject to an ATC clearance
A	IFR only	All aircraft	Air traffic control service	Not applicable	Continuous two-way	Yes
